

## Mounting advice for stabiliser links with mounting surface

Problem:

- Dustcover gets torn and eventually cracks

Cause:

- while mounting, the nut should get tightened and the ball pin should be kept still by the hexagon in it
- use of a pneumatic wrench will turn the dustcover also in a bad position
- the housing of the part isn't in line with the counter part after mounting (see picture in red frame)

Solution:

- always keep the ball pin steady when tightening the nut
- never use a pneumatic wrench to tighten the nuts
- tilt the housing of the part so it's in line with the counterpart (see picture in green frame)
